

Note:

Butt ends of new treated timber pile and existing pile shall have the same diameter. All voids between the existing pile and the new pile section or the pile and the sleeve shall be filled with an epoxy. The epoxy shall be placed on the existing pile end before installing new section and on inside of the sleeve before placing on the pile.

ELEVATION
PILE SPLICE SLEEVE
Scale: $\frac{3}{4}" = 1'-0"$

Notes:

1. Epoxy shall be water insensitive with a consistency of putty.
2. All structural steel shall be ASTM A 709 Grade 36 and be hot-dipped galvanized after fabrication in conformance with ASTM A 153.
3. Hardware shall be ASTM A 325 and be mechanically galvanized in conformance with ASTM A 153.
4. All timber for cross bracing and piling shall conform to Section 462. All timber for new cross bracing shall be No. 1 Southern Pine. All timber for piles shall be Southern Pine. All timber shall be treated with creosote with 20 lb/ft³ retention in conformance with AASHTO M 133.
5. For "Section A-A" see sheet nos. 2 and 3 of 8.

DESIGN GUIDELINES FOR JACKING BEAMS

- 1) The temporary jacking system is to be designed at operating stress levels.
- 2) A five percent increase to the dead load beam reaction is required for deck stiffness.
- 3) Bolts shall be ASTM A 325 with the threads included in the shear plane if possible. The connection shall be designed in bearing with the reduced root area. ASTM A 490 bolts are acceptable.
- 4) Minimum stiffener and connection plate thickness shall be $\frac{1}{2}$ ".
- 5) Designers should attempt to minimize the number of different jacking systems for the bridge by designing a system that will work in multiple locations.
- 6) Minimum fillet weld size shall be $\frac{5}{16}$ ".
- 7) Avoid bent connection plates where possible. If the skew angle does not allow placing straight connection plates from the existing stiffener to the web, attach the connection plate full height to the existing web and design it as a stiffener. Place it far enough from the existing stiffener to allow welding the connection plate to the web and still have full bearing under the jacking system.
- 8) The jack stand can only accomodate a jack with a diameter of 6" or less. Most jacks greater than 75 tons will require a different stand.
- 9) The possibility of shifting traffic off of the stringer to be jacked should be discussed with the ADE-Traffic. This would allow designing for only dead load.
- 10) When designing a jacking beam the designer may want to start with the following trial sections:

* LOAD (X)	BOLTS	BEAM	CONNECTION PLATE
$X \leq 35K$	3 - $\frac{7}{8}$ " ϕ A 325	W 12 x 26	$\frac{1}{2}$ " x 9"
$35K < X \leq 45K$	3 - 1" ϕ A 325	W 14 x 26	$\frac{1}{2}$ " x 11"
$45K < X \leq 60K$	4 - 1" ϕ A 325	W 18 x 35	$\frac{1}{2}$ " x 14 $\frac{1}{2}$ "
$60K < X \leq 80K$	4 - 1" ϕ A 490	W 18 x 35	$\frac{1}{2}$ " x 18"

* Load (X) is dead load and live load plus impact at the bolts

SHEET 7 OF 7

STRUCTURAL REPAIRS

GENERAL NOTES

1. It is preferable to place a single layer of grout bags instead of stacking. Place filter fabric under all grout bags including a single layer of bags.
2. If bags are stacked, overlap the joints of the preceding layer.
3. If possible, bags should be placed so that the top of the bag is at or below the stream bottom. (When filling a scour hole, keep the top of the bag at or below the stream bottom).
4. If the stream bed consists of soils that allow for settlement of the grout bags, do not tie the bags together. If the stream bed consists of a hard stiff soil/clay or an erodable rock, which the grout bags will never be able to settle, tie the grout bags together so they do not get washed away.
5. Grout bags should be no larger than 3' wide, 4' long and 1' thick.
6. The bag placed directly in front of the nose of the pier should be the width of the exposed portion of the pier. Similarly, make sure no gaps form between the bags and the front face of the footing.
7. Do not overfill the bags or allow grout to be poured between the seams of two bags.

GROUT BAG INSTALLATION
GENERAL NOTES

STANDARD NO. BR-SR(0.07)-96-314

SHEET 11 OF 11

STRUCTURAL REPAIRS

GENERAL NOTES

1. Depending on the depth of the undermining, place one grout bag or stack several layers of grout bags along the face of the abutment or pier in front of the undermined area. If bags are stacked, bags in successive rows and tiers shall be staggered.
2. Once the vent/fill pipes have been installed and the bags are filled, pump the grout into the undermined area until material appears in the top of adjacent vent pipes. Cut or remove the vent/fill pipes flush with the top of the bags after the pumping operation is complete.
3. Adequate venting of the water to be displaced in the undermined area is important. The water must be able to escape when it is displaced by the grout pumped into the cavity. A 4' maximum spacing of the vent/fill pipes is recommended.
4. It is important to keep the nozzle buried in the grout during the pumping. This is to reduce the amount of mixing of the grout and the water to be displaced.
5. Debonding jackets should be placed around piles to prevent the grout from adhering to the piles if the exposed height is 3'-0" or greater. This is to prevent the additional weight of the grout from reducing the piles capacity.
6. If possible, clean out unstable material along the bottom of the undermined area prior to filling with grout.

GENERAL NOTES

- Wire Rope:** Wire rope shall meet the requirements of Federal Specification RR-W-410D, Latest Edition, Type 304 Stainless Steel 7 x 19 IWRC aircraft cable, Extra improved plow steel. The cable shall be $\frac{1}{4}$ " diameter having a minimum breaking load of 6400 lbs and a working and a working load limit of 1400 lbs.
- Clips:** Wire rope clips shall be stainless steel and meet Federal Specifications FF-C-450D, Type I, Class I. A minimum of 3 clips shall be installed at each loop fitting. Nuts for clips shall be tightened to a torque of 15 ft-lbs.
- Thimbles:** Wire rope thimbles shall be $\frac{1}{4}$ " heavy stainless steel and meet Federal Specification FF-T-276b, Type III.
- Turnbuckle:** Turnbuckles shall be $\frac{1}{2}$ " diameter with a 6" take up and jaw end fittings at both ends that meet Federal Specification FF-T-791B, Type I, Form I, Class 7. Turnbuckles shall be forged stainless steel, quenched and tempered. Turnbuckles shall have a minimum breaking load of 11,000 lbs and a working load limit of 2,200 lbs.
- Steel Pipe:** Stainless steel pipes shall be nominal $\frac{3}{4}$ " diameter standard weight pipe meeting A 53, Grade B furnished to the dimensions shown on the Plans. The outside edges of the pipe shall be deburred to prevent damage to the wire rope.
- Epoxy Adhesive:** Refer to SHA Specification 921.04.

CONSTRUCTION SEQUENCE

1. Core a 1/4" dia. hole through the existing panel at locations as shown on panel elevation view of appropriate standard sheet.
2. Coat the outside face of the stainless steel pipe and the inside of the 1/4" dia. hole with epoxy adhesive as specified in the General Notes. Allow epoxy to set before threading or tensioning the wire rope.
3. Loop wire rope through stainless steel pipe and fasten turnbuckle as shown on Section A-A of appropriate standard sheet. The turnbuckle shall be taken up to snug tightness and tightened down with the jam nut. Burr turnbuckle threads after tightening is complete.
4. Coat those areas of the neoprene wedges in contact with concrete with lubricant adhesive conforming to 911.04.03 before inserting.

NEOPRENE WEDGE DETAIL

Scale: 1/4" = 1"

Note:
For neoprene specifications refer to M220-67. Color to match existing noise wall.
